

About GreenDelta

GreenDelta is an independent engineering, consulting and software development company founded in 2004. The company works in all areas of Life Cycle Assessment (LCA) and identifies improvements in the sustainability of products and organizations. With openLCA, GreenDelta offers and maintains the world's most used LCA software.

Friedrich Halstenberg
Sustainability Consultant and
Researcher

What the ENGINE project will add to the current scientific state-of-the-art?

In the sustainability work package of ENGINE, the project partners will address the unsolved challenge of how to integrate sustainability in product design. To do so, we will create a sustainable-by-design product development methodology with a refined, integrated Life Cycle Assessment (LCA) model and specifically focus on the reliability of products.

How will the ENGINE project make Europe more sustainable?

ENGINE will show that sustainability and competitiveness are not conflicting goals but complement each other. The solutions developed in ENGINE will be applied and tested in the maritime engine and metal product industries, which are key for European emission reduction.
